08 CJP NEW DESIGN FEATURES

New lifting nuts now standard on all direct buried and pad-mount Cable Junction Pedestals. A 5/8-11 SS nut is welded to a SS backing plate which is bolted to the pedestal wall on both sides. This allows the pedestal to be lifted the same way a single phase transformer is slung. The blind nut is positioned to lift uniformly whether the top is on or off. The lifting eye bolts near the bottom are no longer provided.

New internal white gelcoat now standard on all direct buried and padmount Cable Junction Pedestals. A new mold release system allows us to gelcoat the pedestals on the inside which produces a very clean and smooth surface for stickers to adhere to. The appearance is quite noticeable compared to our competitors.
